Proposed Cortical Parcellation Protocol: SURVEY 1 SURVEY 2

Jason Tourville and Ruth Carper have developed a cortical parcellation (anatomical labeling) protocol that will be used by trained personnel to manually label an initial set of at least 800 to 1,000 T1-weighted MRI brain volumes as part of three different NIH-funded grants ([find out more](#)).

The anatomically labeled brain images will be made publicly available online as a free, downloadable resource. In order to ensure that these anatomical labels are meaningful and useful to the neuroscientific community, we urge you to take the following two surveys.

SURVEY 1, below, collects your comments regarding the protocol. [SURVEY 2](#) takes recommendations for additional datasets you wish to have us manually label.

Instructions

For each survey, please fill in your name and email address, fill in the survey and click the Submit button at the bottom of the survey.

While filling out the first survey, please refer to the figures and tables. To enlarge a figure or table, click on it or on the following links:

[Fig. 2: Lateral, medial views](#)

[Fig. 3: Dorsal, ventral views](#)

[Fig. 4: Lateral sulcus](#)

[Table 1: Sulci](#)

[Table 2: Regions](#)

[Table 3: Planes](#)

Figure 2. Region-delimiting sulci (top) and proposed regions of interest (bottom) of the medial (left) and lateral (right) cortical surfaces are schematized (see lists above for abbreviation definitions). All regions, including optional regions are shown with the exception of entorhinal cortex. Boundaries not formed by sulci are indicated by dotted lines. Dividing planes are labeled (all lower case; dotted lines that are not labeled represent simple extensions of sulci). The curved arrow from the Calcarine Cortex ROI (Calc) to the calcarine sulcus indicates that the ROI lies within the sulcus.

Figure 3. Sulci and ROIs are shown on the dorsal (left group) and ventral (right group) surfaces. Boundaries not formed by sulci are indicated by dotted lines. Dividing planes are labeled (all lower case; dotted lines that are not labeled represent simple extensions of sulci).

Proposed Cortical Parcellation Protocol: SURVEY 1 SURVEY 2

why label brains?

(1) labels serve as a teaching tool or visual guide

(2) labels break up data within a brain

(3) labels establish correspondences across brains

why label brains?

(1) labels serve as a teaching tool or visual guide:

- teach brain anatomy

why label brains?

(1) labels serve as a teaching tool or visual guide:

- teach brain anatomy
- guide neurosurgery

why label brains?

(2) labels break up data within a brain:

- quantify data by brain region

why label brains?

(2) labels break up data within a brain:

- quantify data by brain region
- assign results to brain regions

why label brains?

(3) labels establish correspondences across brains:

- compare individuals within a study

why label brains?

(3) labels establish correspondences across brains:

- compare individuals within a study
- communicate results using a common language

why label brains?

(3) labels establish correspondences across brains:

- compare individuals within a study
- communicate results using a common language
- compare results across studies

how to automate labels?

conventional approach:
atlas-based registration
